The specification describes Neisseria meningitidis polypeptides designated BASB047, BASB054, and BASB069. The polynucleotide sequences can be used to create a vector to transform a host cell.

The host cell can be used to produce the polypeptide. The polynucleotides and polypeptides can be used in vaccine compositions. The polynucleotides polypeptides, and antibodies directed against the polypeptides can be used in compositions for preparation of medicaments. The antibodies can also be used in a composition for treating humans with Neisseria meningitidis disease. The diseases that can be treated include upper respiratory tract infection, and invasive bacterial diseases such as bacteremia and meningitis. The nucleic acid sequences can be used as probes in the disgnosis of Neisseria meningitidis disease. The present sequence encodes a BASB047 polypeptide.
                                                                                                                                                                                                                                                                                                                                          Neisseria meningitidis BASB047, BASB054, BASB068, and BASB069 proteins, useful for treating N. meningitidis infections, bacteremia, and meningitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

                                                                                                                                                                                        US-09-889-746-2 (1-400) x AAS51448
                                                                                                                                                                                                                                                                                                                      Alignment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klabsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.
                                                                                                                                                                                                                                                                                                                                                                                                             The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pseudomonas aeruginosa

                                                                                                                                                                                                                                                                                                                                                                                                   The gene Iut A is entirely located in the Bst E II-Bst E II fragment (3.2 kb) of AAP15972. Comparison with pColV-K30 (99.774 homology) shows the sequence is highly conserved.

4 nucleotide inserts alter the reading frame. The primary amino acid structure is hereby enlarged by 8 amino acide.

A vector for expression is obtained by isolating a fragment contg. the lut A gene from bacterial plasmid or cloning the fragment, and inserting it into an expression is which the ORI is under control of the tac promoter and lut A is under control of the strong "pr" promoter with a temp. sensitive repressor, e.g. pGTI001. Bacteria transformed are cultured at less than 32 degrees Celcius, then raised to 42 degrees for induction of expression.

The method of the invention is useful for determination of the differential expression of the genes of M. capsulatus, and for studying gene expression on a genomic scale and in gene expression assays of M. capsulatus genes. The sequences shown in ABQ90016-ABQ91855 represent M. capsulatus genes for use in arrays of the

```
Porphorymonas gingivalis (PG) polypeptide sequences given in AAY14318 to AAY14583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                               AAX91536 to AAX91801 encode two hundred and sixty six antigenic

                                                                                                                                                                                                                                                                                                                         Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY3483. AXY31802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     23-APR-1998;

AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34833. AAX91802 to AAX91809 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis. Probes can assays. Porphorymonas gingivalis in standard hybridisation especially gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   432

                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel DNA sequences (I) that encode iron or CC heavy metal transporters (II). The invention also describes (1) a CC recombinant expression vector (III) containing (1); (2) prokaryotic or CC eukaryotic cells (III) transformed with (I) or (III); (3) production of CC (II) by culturing (III); (4) (partial) expression products (IV) of (I) CC and synthetic proteins or peptides with the same sequences; (5) CC antibodies (Ab) specific for (IV); (6) hybridoma cells that produce CC monoclonal Ab; and (7) transgenic plants that contain (III). The iron or CC heavy metal transporters encoded by (I) transport heavy metal ions across CC cell walls and regulate homeostasis of trace elements. (I), and their CC fragments are useful for: (1) expression of (II); (2) as probes and CC primers for detection, isolation and amplification of full length cDNA CC growth, development and yield of plants, particularly Leguminosae, CC cells that express the iron or heavy metal transporters take up heavy CC metals, so reduce pollution of soil and release iron and other trace CC metals which improves soil quality and protect plants against pollutants
                                                                                                                                                                                                                                                       US-09-889-746-2 (1-400) x AAF26439 (1-885)

AAX91516 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAX34583. AAX91802 to AAX91889 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TCGCTCTACGGATCCGATGCCATCGCCGGGGTAATCAATGGATCACAAAAAAGAATACG 732

The CC polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC expensible for generic disorders or other traits to assess biodiversity amino acid sequences of data and products dependent on DNA and CC amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed cateful in the printed contraction of the printed of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Alignment

havy metal transporters (11). The inventional spot describes (1) a recombinant expression vector (III) containing (1); (2) prokaryotic or evkaryotic cells (III) transformed with (1) or (III); (3) production of (II) by culturing (III); (4) (partial) expression produces (IV) of (1) and synthetic proteins or peptides with the same sequences; (5) and synthetic proteins or peptides with the same sequences; (5) can synthetic proteins or peptides with the same sequences; (5) can divide (AD) specific for (IV); (6) hybridom cells that produce monoclonal Ab; and (7) transporters encoded by (1) transport heavy metal ions across cell walls and regulate homeostrasis of trace elements: (I), and their fragments are useful for: (1) expression of (II); (2) as probes and primers for detection, isolation and amplification of full length cDNA cequences; and (3) producing transgenic plants; (II) are used to promote growth, development and yield of plants, particularly Leguminosae, captomics and yield of plants, particularly Leguminosae, cells that express the iron or heavy metal transporters take up heavy metals, so reduce pollution of soil and release iron and other trace metals, so reduce pollution of soil and release iron and other trace. New DNA encoding iron or heavy metal transporters, useful for promoting growth of plants on polluted soil -GAAACGCTCAGCGACCCTAACCAGATCGAACTCCAGGCCCTGAGCATCACCAGTACTGCC 126 127 GACAGCGAACGCGCCGACGGCCCGGTCGAAGGCTACAAGGCCACCCGCTCGGCCAGTGCC 186 ProSerLeuGlyValSerSerGlyThrThrSerAsnPheGlyGln------ 102 ---GACTACGCCGGTGGTGTCGGCCGCGCCACAACTTCGGTGGCCAGGGCCTGACAACC 345 GlnIleGlnGluGlnAlaThrGlySerArgGlnLeuAlaAspValMetAlaGlnLeuIle 87 9 TrpLeuSerLeuProLeuLeuSerValAlaValThrGlnGlnLeuTyrAlaGlnProAsn 28 -----IleAspLysSerGlyMetAlaLeuAla 51 52 AsnArg------IleThrGlnMetProHisThrLysValIleTyrGluGlu 67 13 TTCGTTTCGCTTTGTCTTCAT---GCTGTCTCCCCGCTGGCCTTTGCCGAGCCT---247 GTGCTGGTAGAC-----ACGGGGCCCACGCGCCTGCAGGAAGGCCTG-----GluSerLeuPro-----ThrValGluLeuGluProValValIleThr-----This invention describes novel DNA sequences (I) that 611 G; 346 T; 2 other; 84 62 122 107 Length:

This invention describes novel DNA sequences (I) that encode iron or heavy metal transporters (II). The invention also describes (1) a crecombinant expression vector (III) containing (I); (2) prokaryotic or eucharyotic cells (III); the further with (1) or (III); (3) production of (II) by culturing (III); (4) (partial) expression products (IV) of (I) and synthetic proteins or peptides with the same sequences; (5) and synthetic proteins or peptides with the same sequences; (5) and specific for (IV); (6) hybridoma cells that produce monoclonal Ab; and (7) transporters encoded by (I) transport heavy metal ions across cell walls and regulate homeostasis of trace elements. (I), and their fragments are useful for: (I) expression of (II); (2) as probes and primers for detection, isolation and amplification of full length cDNA sequences; and (3) producing transgenic plants, ili) are used to promote growth, development and yield of plants, particularly Leguminosae, coplants. They also improve homeostasis of iron and trace elements. Host cells that express the iron or heavy metal transporters take up heavy metals, so reduce pollution of soil and release iron and other trace metals, which improves soil quality and protect plants against pollutants
                                                                                                                                                                                                                             transporters, useful for promoting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a library of DNA fragments of Escherichia coli strains comprising polynucleotides (ABA88577-ABA88729 and ABA89533) and encoded proteins (ABB52459-ABB52919 and ABB53994) of nature B2/D+A-. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, palliate or prevent extra-intestinal E. coli infections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1980 BP; 489 A; 481 C;

The invention in production of long chain poly-unsaturated fatty acid (PUFA) productions Genes responsible for eloosapentenoic acid (EPA) production in Shewanella putrefactens and novel genes associated with the production of docoaahexanoic acid (DHA) in vibrio marinus are used production of docoaahexanoic acid (DHA) in vibrio marinus are used to the production of docoaahexanoic acid (DHA) in vibrio marinus are used to part as associated with PUFA production. The PKS-like genes are concents of PUFA (specifically DHA and EPA). Oils from these altered contents of PUFA (specifically DHA and EPA). Oils from these confines are useful as dietary supplements (in infant feededing formulations, to give a PUFA profile closer to that of human milk; for treating malnutrition; in intravenous feeding formulations; in cooking colls, fars ecc.), also as anti-inflammency agents and for reducing cholesterol levels. Fragments from the genes are useful as probes to close related molecules or to detect organisms that express PKS-like cholesterol levels. Fragments from the genes are useful as probes at complesserol by the pression of PUFA in seeds allows simple recovery, as oil which can be confineered to have a particular PUFA profile. Expression in microbes also allows simple recovery and control of PUFA profile and is not subject to external variables such as weather or food supply. The present sequence continues in AA200311 from nucleotide 20020. The sequence continues in AA200311 from nucleotide 20020. The sequence continues given in the specification with the information that it was missing at the time of publication). The whole S. putrefaciens PKS-like cluster partial fragment from S. putrefaciens PKS-like cluster partial fragment from S. putrefaciens PKS-like cluster partial fragment from S. putrefaciens PKS-like cluster partial fragment from S. putrefaciens PKS-like cluster partial fragment from S. putrefaciens PKS-like cluster partial fragment from S. putrefaciens PKS-like cluster partial fragment PKS profile and s partial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides polyketide-like synthesis (PKS)-like genes that
                                                                                                                                          New nucleic acid encoding polyketide-like synthesis enzymes of Vibrio marinus - and transformed plants and microbes that produce polyunsaturated fatty acids, useful as pharmaceuticals and food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 18831 BP; 5760 A; 4229 C; 3822 G; 5020 T; 0 other;

Cluster:
A novel EPA (useful in drugs, pesticides, foods and feedstuffs) is encoded by synthetase enzyme gene sequences comprising parts of the encoded by synthetase enzyme gene from the marine microorganism S. full sequence of the synthetase gene from the marine microorganism S. putrafaciens SCRC-2874 (PERM BP-1625), in which at least 1 of the 9 open reading frames (ORF) (numbered 2-10) in the gene have been deleted. In particular the gene sequences comprising the Collowing parts of the full gene:
C (1) bases 8081-9441, 12314-13084 and 13889-32520;
C (2) bases 8081-9441, 12314-13084 and 13889-32520 and 34627-35559;
C (4) bases 8081-9441, 9681-13084 and 13889-32520 and 34627-35564; and c (5) bases 8081-9441, 9681-13084 and 13889-32520 and 34627-35564; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |||:::

                                                 CC (PK)-like synthesis (PKS-like) pathway genes from Shewanella, Vibrio CC and Schizochtrium. The nucleic acids are useful for isolating related CC molecules or in methods to detect organisms expressing the PKS-like CC genes. They are also useful for creating transgenic plants that express CC poly-unsaturated long chain fatty acids. The poly-unsaturated long chain fatty acids. The poly-unsaturated long chain fatty acids or treating transgenic plants that express cc maintrition. The poly-unsaturated long chain fatty acids can also be compared into cooking oils, fats or margarine formulated so that in commal use the recipient receives a desired amount of poly-unsaturated CC long chain fatty acids. The nucleic acids are also useful in large scale production of docosahexenoic acid and eicosapentenoic acid, and for the conditication of the fatty acid and eicosapentenoic acid, and for the fatty acids in particular host cells allows quicker purification from CC tissues and/or plant parts. Transgenic production of polyunsaturated CC fatty acids in particular host cells allows quicker purification from CC unsured such as fish or plants. This sequence represents the CC Shewanella purerfaciens DNA sequence encoding the PKS gene cluster uncorporating ORF3 to ORF9.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a plasmid prepared by cloning the Shewanella putrefactions SCRC-2874 (FERM BP-1623) elcosapentanoic acid (EPA) synthesis gene cluster into a broad host vector. The plasmid is used to transform cyanobacterium and produce EPA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10275
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10170
           The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (NIMR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulators. NIMR nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virulence of a microbe in a subject suffering from an infection. AAS46232-AAS46278 represent Escherichia coli NIMR coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                          WPI; 200

The invention is parameted busylous to the invention is into invention is propertied (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymerlectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capponatile, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. A&S64197-A&S4564 represent novel human diagnostic coding sequences of the invention.

Conno acid sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
